

✓ Enum

- Enums in Python are used to define a set of named constant values.
- Enumerations are created using classes.
- Enums have names and values associated with them.

```
import enum
```

```
class Day(enum.Enum):  
    Sunday = 1  
    Monday = 2  
    Tuesday = 3
```

✓ Properties

```
print("The string representation of enum member is : ", end="")  
print(repr(Day.Sunday))
```

The string representation of enum member is : <Day.Sunday: 1>

```
print("The type of enum member is : ", end="")  
print(type(Day.Sunday))
```

The type of enum member is : <enum 'Day'>

```
print("The name of enum member is : ", end="")  
print(Day.Sunday.name)
```

The name of enum member is : Sunday

```
print("All the enum values are: ")  
for Dy in Day:  
    print(Dy)
```

All the enum values are:
Day.Sunday
Day.Monday
Day.Tuesday

```
di = {}  
di[Day.Sunday] = "Holiday"
```

```
di[Day.Tuesday] = "Working day"
```

```
if di == {Day.Sunday : "Holiday", Day.Tuesday : "Working day"}:  
    print("Enum is hashed")  
else:  
    print("Enum is not hashed")
```

Enum is hashed

```
for Dy in di:  
    print(f"{Dy.name} is {di[Dy]}")
```

Sunday is Holiday
Tuesday is Working day

Day.Sunday

<Day.Sunday: 1>

```
print("The enum member associated value 2 is : ", end = "")  
print(Day(2))
```

The enum member associated value 2 is : Day.Monday

```
print("The enum member associated with name Tuesday is : ", end = "")  
print(Day["Tuesday"])
```

The enum member associated with name Tuesday is : Day.Tuesday

```
mem = Day.Sunday  
print("The value associated with Sunday is : " , end = "")  
print(mem.value)
```

The value associated with Sunday is : 1

```
print("The value associated with Sunday is : " , end = "")  
print(mem.name)
```

The value associated with Sunday is : Sunday

```
if Day.Sunday is Day.Monday:  
    print("Sunday and Monday are same")  
else:  
    print("Sunday and Monday are different")
```

Sunday and Monday are different

```
if Day.Sunday != Day.Monday:  
    print("Sunday and Monday are different")  
else:  
    print("Sunday and Monday are same")
```

Sunday and Monday are different

```
if Day.Sunday is not Day.Monday:  
    print("Sunday and Monday are different")  
else:  
    print("Sunday and Monday are same")
```

Sunday and Monday are different
