LECTURE No 03

SIR SUHAIL IMRAN

✓ List

```
name = ["Python", "Anaconda", "mySQL"]  
list
```

```
list
```

```
name[0][2]
```

```
't'
```

```
print(f"I am using {name[0]}.")
```

```
I am using Python.
```

```
name[-1] = "Oracle"
```

```
name
```

```
['Python', 'Anaconda', 'Oracle']
```

```
del name[1]
```

```
name
```

```
['Python', 'Oracle']
```

✓ Functions ()

```
name.append("Anaconda")
```

```
name
```

```
['Python', 'Oracle', 'Anaconda']
```

```
name.remove("Anaconda")
```

```
name1 = ["Spyder", "PyCharm", "Python"]
```

```
name.extend(name1)
```

```
name
```

```
['Python', 'Oracle', 'Spyder', 'PyCharm', 'Python']
```

```
name.insert(2, "VSCode")
```

```
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder', 'PyCharm', 'Python']
```

```
name.append("C++")  
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder', 'PyCharm', 'Python', 'C++']
```

```
del name[-3:-1]
```

```
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder', 'C++']
```

```
name.pop()  
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder']
```

```
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder']
```

```
name[:0:-1]
```

```
['Spyder', 'VSCode', 'Oracle']
```

```
name[3::-1]
```

```
['Spyder', 'VSCode', 'Oracle', 'Python']
```

```
name
```

```
['Python', 'Oracle', 'VSCode', 'Spyder']
```

```
name.index("Spyder")
```

```
3
```

```
name * 2
```

```
['Python',  
'Oracle',  
'VSCode',  
'Spyder',  
'Python',  
'Oracle',  
'VSCode',  
'Spyder']
```

```
"python" in name
```

```
False
```

```
name.sort()
```

```
name
```

```
['Oracle', 'Python', 'Spyder', 'VSCode']
```

```
name = ["Python", "python", "Oracle", "oracle", "Mysql", "mysql"]  
name.sort()  
name
```

```
['Mysql', 'Oracle', 'Python', 'mysql', 'oracle', 'python']
```

✓ Mathematical Functions

```
ages = [23, 16, 14, 28, 19, 11, 38]
```

```
youngest = min(ages)  
eldest = max(ages)  
total_ages = sum(ages)  
count = len(ages)  
average = total_ages / count  
  
print(f"Youngest age is {youngest}.")  
print(f"Eldest age is {eldest}.")  
print(f"Total ages is {total_ages}.")  
print(f"Count is {count}.")  
print(f"The average age is {round(average, 1)}.")
```

```
Youngest age is 11.  
Eldest age is 38.  
Total ages is 149.  
Count is 7.  
The average age is 21.3.
```

```
ages.sort(reverse=True)
```

ages

[38, 28, 23, 19, 16, 14, 11]
