LECTURE No 04

SIR SUHAIL IMRAN

✓ Conditions in Python

```
marks = float(input("Enter your marks: "))
if marks >= 80:
    grade = "A"
elif marks >= 70:
    grade = "B"
elif marks >= 60:
    grade = "C"
else:
    grade = "F"
print("Your grade is: ", grade)
```

Enter your marks: 56
Your grade is: F

```
marks = float(input("Enter your marks: "))

if marks >= 80:
    grade = "A"
elif marks >= 70 and marks < 80:
    grade = "B"
elif marks >= 60 and marks < 70:
    grade = "C"
else:
    grade = "F"
print("Your grade is: ", grade)
```

Enter your marks: 73
Your grade is: B

```
a = float(input("Enter any number: "))
b = float(input("Enter any number: "))
c = a + b
print(f"Sum of {a} and {b} is {c}.")
```

Enter any number: 4
Enter any number: 6
Sum of 4.0 and 6.0 is 10.0.

```
a = float(input("Enter any number: "))
b = float(input("Enter any number: "))
operator = input("Enter an operator '+' or '-': ")
if operator == "+":
    result = a + b
elif operator == "-":
    result = a - b
elif operator == "*":
    result = a * b
elif operator == "/":
    result = a / b
else:
    print("Invalid operator.")
print(f"Result is {result}.")
```

Enter any number: 3
Enter any number: 6
Enter an operator '+' or '-': -
Result is -3.0.

```
Temperature1 = float(input("Enter Temperature in Celcius: "))
Selection = input("Enter Unit, Type 'F' for Fahrenheit and 'C' for Celcius: ")

if Selection in ['C', 'c']:
    Temperature = (Temperature1 * 9/5) + 32
    input_unit = "C"
    output_unit = "F"

elif Selection in ['F', 'f']:
    Temperature = (Temperature1 - 32) * 5/9
    input_unit = "F"
    output_unit = "C"
else:
    Temperature = "Invalid Selection."
```

```
input_unit = ""  
output_unit = ""
```

```
print(f"{Temperature1} °{input_unit}→{Temperature} °{output_unit}")
```

```
Enter Temperature in Celcius: 0  
Enter Unit, Type 'F' for Fahrenheit and 'C' for Celcius: C  
0.0 °C→32.0 °F
```
